```
!  This is a test program for version 1.4 of module FM_DOUBLE_INT, which contains the interface
!  routines allowing quadruple-precision real variables in the user's program to be used in
!  assignments, arithmetic, and comparisons involving type (fm), (im), and (zm) variables.
!  The same operations are provided as those in the basic module FMZM for single or double
!  precision variables.

!  All of the routines in module FM_DOUBLE_INT are tested, and if all tests are completed
!  successfully, this line is printed:

!  280 cases tested.  No errors were found.
